During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above. IMPORTANT: Fils sequence is not the entire insert of clone 973M2. It may be shorter because we arrange for a small overlap between neighbouring submissions. The true left end of clone d4936p19 is at 84313 in this sequence. This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alul). Where the sequence is ambiguous, there is an annotation using the 'unsure' feature key. This sequence was generated from part of bacterial clone contigs of human chromosome 1, constructed by the Sanger Centre Chromosome 1 human chromosome 1, constructed by the Sanger Centre Chromosome 1 http://www.sanger.ac.uk/HGPyChrl 973M2 is from the library RPCI5 constructed at the Roswell Park Cancer Institute by the group of Pieter de Jong. For further details see http://bacpac.med.buffalo.edu/ VECTOR: pCTPRC2.

                                 The primer corresponds to the 3' end of the cyclooxygenase-2 (COX2) CDNA sequence, and is used with Q70998 in a reverase transcription polymerase chain reaction analysis of osteosarcoma 143.98.2 cells. Results with this primer pair indicate that osteosarcoma cells express COX-2 mRNA. The COX-2 protein is used in assays to identify inhibitors which have antiinflammatory, antipyretic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     High level expression of human cyclo:oxygenase (COX)-2 - using new 3' flanking region from COX-1, useful in assays for identifying potent, selective or preferential inhibitors of COX-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ends of

Methods from the present invention may be used to select individuals for clinical trials and predict responses to treatment with drugs. The polynucleotides may be used in hybridisation assays, sequencing assays and specific marker (ERBM) or 12-LO-related biallelic marker (ERBM) or 12-LO-related biallelic marker, and for amplifying a segment of nucleotides containing an ERBM. The polynucleotides are useful in diagnostic kits. The markers may be used to detect conditions and genotypes associated with arachidonic acid metabolism. C57367 to C58018 and B24019 and B24020 represent sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       exemplification of the present invention.

N.B. Polymorphic bases (single nucleotide polymorphisms also known as SNPs) in the polynucleotide sequences from the present invention have been given as their corresponding degenerate bases e.g. a polymorphic

Nucleic acid encoding human prostaglandin H synthase-2 - used in treating and detection of inflammation, pre-term labour, cancer, etc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A DNA clone (T59635) codes for human glucocorticoid-regulated prostaglandin H synthase 2 (PGHS-2) (W12698), an enzyme responsible for increased prostaglandin synthesis associated with inflammation. It was obtd. by PCR amplification of RNA isolated from serum- and cycloheximide-treated human fibroblast W138 cells, using PGHS-2-specific primers (see also T59638-39). The gene can be used to express recombinant PGHS-2 in transformed host cells for use in identifying cpds. that inhibit PGHS-2. It can also be used to detect expression of PGHS-2 as a means of diagnosing certain by

PCR primers specific for the human PGHS-1 and PGHS-2 sequences were engineered to amplify the coding regions of either one transcript or the other (see Q61793-95). PCR products of about 2 kb were generated. Three PGHS-2 clones were sequenced in both directions. The clone comprising the PGHS-2 sequence disclosed in O61790 was selected for transfection. This sequence differs from the human PGHS-2 sequence disclosed by Hla and Heilson, PMS, 89, 7384 (19920 due to a Glu at rather than a Gly at AA posn. 165. Mouse PGHS-2 also has a Glu at

                                                                                                                                                                                                                                                                                                                                                                                Full-length cDNA derived from human osteosarcoma cells (given in Q89375) encoded human COX-2 (R72228). High-level expression of COX-2 in COS7 cells was achieved using a vaccinia or baculovirus vector and a construct in which COX-2 cDNA was attached at its 5' end to a 3' flanking sequence of human COX-1 cDNA (Q89377).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human low adenosine antisense oligonucleotide related sequence #2682
                                                                                                                                                                                                                                                                      High level expression of human cyclo:oxygenase (COX)-2 - using new 3' flanking region from COX-1, useful in assays for identifying potent, selective or preferential inhibitors of COX-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               100.0%; Score 19; DB 16; Length 3387; 100.0%; Pred.                                                                                                                                                                                                                                                           oligonucleotides and compositions (1) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (1) can have respiratory, bronchodilator, antinilammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (1) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and chemokine receptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system controls.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      fragments
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                receptors, CNS and peripheral nervous and non-nervous system peptide transmitters, defensing, growth factors, vasoctive peptides and entransmitters, defensing, growth factors, associated proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary
                                                                                           Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             phosphorothioate; impaired respiration; inflammation; allergy; allergic disease; bronchoconstriction; inhibitor; antiinflammatory; antiallergic; antiasthmatic; cytostatic; analgesic; impaired airway; lung disease; ischaemic condition; pulmonary vasoconstriction; asthma; respiratory distress syndrome; pain; cystic fibrosis; emphysema; pulmonary hypertension; chronic obstructive pulmonary disease; COPD;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 hypertension, emphysema, chronic obstructive pulmonary disease (COPD), pulmonary transplantation rejection, pulmonary infections, bronchitis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                           The present invention describes low adenosine (A) content antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; adenosine receptor; low adenosine antisense oligonucleotide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              and/or cancer. F18434 to F21543 represent human polynucleotide fr and antisense oligonucleotides used in the exemplification of the

The present invention describes a new composition comprision of objectives of objective to disponuclectide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary of effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emplysema, chronic obstructive pulmonary disease (COPD), and cancers syndromes the lungs, including breast and prostate cancer. The reduction of the adenosine content of the breast and prostate cancer. The reduction of the adenosine content of the release of deoxyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. A32313 to A35312 represent the

Oligonucleotides and compositions (I) comprising them. In the natisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antilinflammatory, analgesic, amunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with ung/respiratory disorders and mallgnancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoslobulins and antibodus, antibody receptors, cytokine and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and chemokine receptors, adenosine receptors, bradykinin receptors, contrainervous system (NS) and peripheral nervous and non-nervous system receptors, the antisense oligonucleotides may be used in this way to treat disorders including proteins and mallgnancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoonstriction) and/or lung inflammation, allergy(les) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiratory distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (CODD), and/or cancer pladia, the profession pulmonary pulmonary pulmonary pulmonary pulmonary disease (CODD), and/or cancer pladia, the pulmonary pulmonary pulmonary concertions. Pulmonary pulmonary concertions, bunchly or pulmonary pul
respiratory obstruction; pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary vasoconstriction; asthma; RDS; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pulmonary transplantation rejection; chronic obstructive pulmonary disease; pulmonary infection; bronchitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               and/or cancer. F18434 to F21543 represent human polynucleotide fragments and antisense oligonucleotides used in the exemplification of the

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets concleid acids involved in bronchoconstriction, allergies, and/or continucial involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antialfalmentory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation. The ON can be used for treating effects afflict the lungs of a subject. They can be used for treating effects afflict the lungs of a subject. They can be used for treating cf. stochaemic conditions, pulmonary vasconstriction, allergies, asthma, impeded respiration, respiratory distress such as leukaemias, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the conchoconstriction and inflammation. Assiss break down with the release of deoxyadenosine which activates adenosine receptors causing conchoconstriction and inflammation. Assiss to Assiss the present the invention, which correspond to SEQ ID NO: 1 to 185, but the sequences of differ from the previously named sequences. SEQ ID NO: 1 to 1860 (A32323 to A3392) are specifically claimed ONS from the present invention.

On the production of the present invention of the match up with their corresponding SEQ ID NO: sequences given in the force of the present invention of the match up with their corresponding SEQ ID NO: sequences given in the sequence listing

specification which each code for the same 218 amino acid sequence of Paracoccus denitrificans thiamine pyrophosphokinase. The two sequences differ by silent substitutions in codons 2-7 which were introduced into T08723 by insertion of a synthetic linker. Paracoccus bacteria transformed with the coding sequence are useful for increased production of thiamine diphosphate from thiamine and adenosine 5'-triphosphate.

Paracoccus bacteria transformed with the coding sequence are useful for increased production of thiamine diphosphate from thiamine and adenosine 5'-triphosphate.

                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                          Antisense oligonucleotides were designed based on the 5'-UTR and 3'-UTR sequences of mouse and human cyclooxygenase cDNAs. The phosphorothicate derivs. ("s-oligonucleotides") of the different antisense sequences were found to be effective for inhibiting translation of cyclooxygenase and subsequent production of prostaglandins and thromboxanes. The S-oligonucleotide derivs of 091475-091484 are based on the human cyclooxygenase-2 cDNA and are useful for antisense therapy of ARDS, glomerulitis, rheumatoid arthritis,

Disclosure; Page 966-968; 1592pp; English.

XX

The present invention describes low adenosine (A) content antisense cligonucleotides and compositions (I) comprising them. In the antisense cligonucleotides the A is replaced by a 'Universal' or alternative base.

CC oligonucleotides the A is replaced by a 'Universal' or alternative base.

CC immunosuppressive, antiathmatic, hypotensive and cytostatic activities caperassion and or activity of target polypeptides associated with antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with univolybobulins and antibodds, antibody receptors, cytokines and crimmunoglobulins and antibodds, antibody receptors, cytokines and crimming proteins, adhesion molecules and their receptors, cytokine and chemokines and peripheral nervous and non-nervous system peptide chemokines, and peripheral nervous and non-nervous system peptide creeptors, and peripheral nervous and non-nervous system peptide creeptors, defensins, growth factors, wassociated proteins. The antisense oligonucleotides may be used in this way to treat disorders inceptors, binding proteins and mailingancy associated with a disease or condition selected from pulmonary vasociated with a disease or condition selected from pulmonary vasociated with a disease or condition selected from pulmonary used condition, altergikes, asthma, impeded respiration, respiratory distress syndrome (RDS) pain, cystic fibrosis (CD), allory discass (COPB), pulmonary transplantation rejection, pulmonary infections, bronchitis, and antisense oligonucleotides used in the exemplification of the present invention.

/lab_host="Ecori Important food crop in the world. Half of the world population, especially those inhabiting highly populated areas of the humid tropics and subtropics, rely on rice as their primary source of carbohydrate.
Monocotyledonous rice is a diploid plant (2n=24) with a haploid genome equivalent of 411 Map (Arumqanathan and Earle, 1991). The relatively small genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryza sativa, Nipponbare variety using EcoRI as the cloning enzyme. The
Nipponbare variety using EcoRI as the cloning enzyme. The library contains 55,296 clones with an average insert size of 121 Kb providing approximatley 15 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 %. Three high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening and can be requested from the Clemson University BAC/EST Resource Center (www.genome.clemson.edu)."

library contains 55,296 clones with an average insert size of 121 Kb providing approximatley 15 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 %. Three high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening and can be requested from the Clemson University BAC/EST Resource Center (www.genome.clemson.edu)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Eukaryota: Metazoa; Chordata; Craniata; Vertebrata; Actinopterygii; Neopterygii; Teleostei; Eutaleostei; Acanthopterygii; Percomorpha; Terraodontiformes; Tetraodontoidei; Tetraodontidae; Fugu.

Patent No. 6048850

GENERAL INFORMATION:
APPLICANT: Young, Donald A.
APPLICANT: You's Winn, Wirginia D.
TILLE OF INVENTION: METHODS FOR INHIBITING PROSTAGLANDIN
TITLE OF INVENTION: SYNTHESIS IN A MAMMALIAN HOST
NUMBER OF SEQUENCES: 18
CORRESPONDENCE ADDRESS:
ADDRESSEE: Pennie & Edmonds
STREET: 1155 Avenue of the Americas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        100.0%; Score 19; DB 3; Length 1834; 100.0%; Pred.
